BBE RELEASE TODAY!

NOW WE'RE LAUNCHING GREAT IMPROVEMENTS IN BBE, MANY OF THEM BASED ON VALUABLE FEEDBACK FROM OUR CUSTOMERS.

BBE release

Added security

Protection of user data is a key component

For added security we have introduced an improved and more granular way to restrict access to the system.

The first new feature is that BBE admins can limit user access to our different APIs following the Principle of least privilege (PoLP).

We are also introducing the possibility to control which APIs are exposed towards external parties to better protect customer data.

And as the last new security feature Admin can set BBE to automatically block stale user accounts.

Availability and how to get started

This feature is included in the original product and is available directly after upgrading to this version.

More dashboards

For an easy overview of your network growth development

We continue our development towards presenting more dashboards in BBE, two new ones are available to you as of the October launch:

- First is a dashboard that shows the development of the number of connected geographic addresses.
- Second Dashboard is presenting your largest service providers based on revenue.

Dashboard of number of connected geographic addresses over time

This dashboard shows a graph of the development of the total number of

connected addresses and the addresses that were connected last month. It gives you an easy overview and good understanding of your network growth development.

Dashboard of largest service providers based on revenue

As a step towards offering the ability to quickly and easily set goals in BBE in the future, we are now launching a dashboard that presents your largest service providers based on revenue. With this dashboard, you get a good overview of your service providers and you get a smooth tool for producing sales figures.

Availability and how to get started

This feature is included in the original product and is available directly after upgrading to this version. In order to get correct figures in the dashboard, Price Lists needs to be in use. Details about implementing Price Lists are found in the User Manual, chapter 11.

Great improvements to the usability

For a more efficient day-to-day work

We have listened to our customers and as a part of our continues work to simplify the day-to-day work for both you as a BBE user and as a BBE administrator of the system, the following improvements have been implemented in this release:

- As a BBE user, you will be able to reset your own login, which gives you more power to act and therby saves you and the administrator valuable time.

- The existing tool for mass-mailing that is available for you as a BBE administrator, now also supports reaching all users of the system, quickly and efficiently.

- In order for the two previous function to operate, an email address is crucial. Now you will have the choice to make a valid email address mandatory when a new account is created.

Makes day-to-day work more effective

Availability and how to get started

This feature is included in the original product and is available directly after upgrading to this version.

For more information and an upgrade:
- Please contact your PacketFront contact or your BBE partner.
- If you perform the upgrade yourself, you will find all the required information in your Installation Guide.
